XS-ZTR Series

Nuclear Radiation Resistant LVDT

DESCRIPTION

The XS-ZTR Series LVDT is designed for measuring displacement at very high and cryogenic temperatures. The XS-ZTR operates continuously at 550°C and will survive 650°C for several hours. The XS-ZTR is also designed to perform within specification after exposure to a total integrated flux of 1011 rads gamma or 3 x 1020 NVT.

The XS-ZTR is made exclusively from inorganic materials, principally metals and ceramics. Windings are of ceramic insulated precious metal alloys; joints are welded or brazed with high temperature alloys. Leads are sheathed in stainless steel. Conductors are typically nickel with magnesium oxide insulation. Materials are selected to have compatible expansion coefficients in order to minimize thermal stresses. Most inorganic insulations are hygroscopic so the entire coil assembly is weld sealed into a stainless steel shell. This process prevents moisture accumulation and insulation leakage. It also seals out hostile surrounding media while permitting the core to move freely. The cable can be terminated by a sealed header or connector when required.

FEATURES

- Withstands Total Integrated Neutron Flux Levels to 3 x 1020 NVT
- Withstands total integrated radiation of 1011 rads or 109 gray
- Suitable For Continuous Operation From -320°F (-195°C) Up to 1022°F (550°C)
- Survives Non-Operating Temperatures Up to 1200°F (650°C)
- Special Temperature Calibrations Available
- Calibration Certificates Supplied with All Models

APPLICATIONS

- Nuclear Reactor Containment Vessel Bolt Tension
- Cryogenic Medicine
- Space Research
- Jet Engine Gimbal Position Feedback
- Roll Gap On Steel Hot Strip and Slabbing Mills

OPTIONS

- Metric Thread Core

For moderate temperature and radiation applications, consider the HR or HCA LVDTs (with 080 option), or the MHR series (with special order vented case).

Radiation Resistance

Certain applications require resistance to a combination of gamma radiation, neutron radiation and high temperature. Before considering detailed specifications and suitability for a particular application a review of some working definitions and equivalents is in order:

nvt = integrated flux or fluence
= neutron density x velocity x time
= n/m3 x m/s x s
= n/m2

rad = radiation absorbed dose
= radiation that will deposit 100 ergs per gram

n/cm^2 = 4.17×10^{-9} rads

n/cm^2 = 4.17×10^{-7} ergs/gm

1 Gray (gy) = 100 rad absorbed dose

1 rad/hr = approximately 7 x 108 neutrons/m^2s^2

All radiation produces some damage, therefore, the issue becomes how much radiation and what kind of radiation can an object sustain while maintaining its operation specification. At best, this can only be an estimate.

When radiant energy falls on an object, equal amounts of energy from different sources may result in greatly differing amounts of damage depending on the form of radiation, i.e. gamma rays, neutrons, etc. These different sources may also result in qualitatively different kinds of damage. One method to quantify these differences is to determine the rate of radiation that a unit can withstand without instantaneous and unacceptable damage. Another method is to determine the total integrated flux that can be absorbed before "wear-out" damage from radiation occurs. The distinction between rate of flux and total integrated flux must be kept clearly in mind.

There is no direct relationship between neutron fluence and gamma radiation. If we assume equal energy dissipation from differing sources, the energy absorbed by the unit will vary with its absorption cross section. If we try to equalize damage, there is even more uncertainty because of the qualitative differences of the damage caused by various forms of radiation.

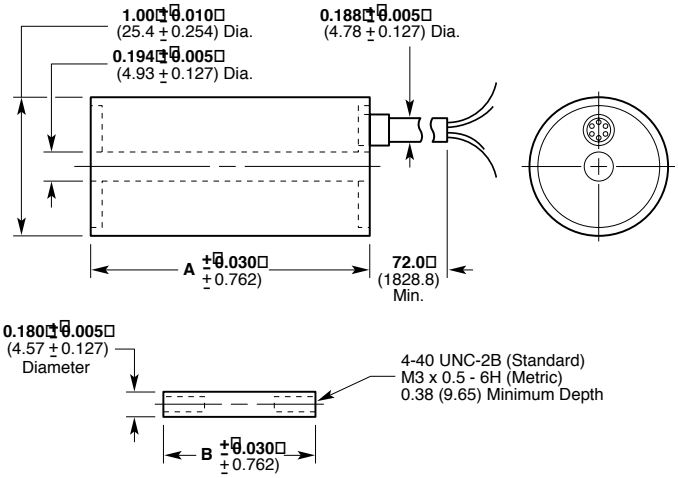
1000 XS-ZTR
2000 XS-ZTR

options

Number	Description
006	Metric Thread Core

dimensions

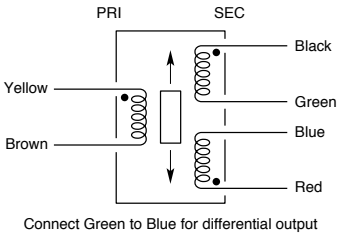
in (mm)



specifications

Input Voltage	3 V rms (nominal)
Frequency Range	400 Hz to 5,000 Hz
Operating Temperature Range	-320°F to 1022°F (195°C to 550°C)
Survival Temperature Range	-450°F to +1200°F(-270°C to 650°C)
Null Voltage	<0.5% full scale output
Shock Survival	10 g for 11 msec
Vibration Tolerance	10 g up to 2 kHz
Coil Form Material	Ceramic
Housing Material	AISI 304 series stainless steel
Lead Wires	28 AWG solid nickel, MgO insulated, 72 inches (180 cm) long (nominal): 3/16 inch (4.75 mm) diameter stainless steel sheath, 1/2 inch (12.5 mm) minimum bend radius

wiring



Connect Green to Blue for differential output

Standard termination is a multiple conductor 6-foot (1.8 m) long, 3/16 inch (4.75 mm) diameter swagged stainless steel cable. Other lengths and diameters are available on special order.

A frequently specified alternative termination is a pair of 2-conductor 1/16 inch (1.6 mm) diameter stainless steel sheathed cables. These are particularly suitable for applications where the cables are routed through an arduous path within the reactor.
